

The Lorenz Equations: Bifurcations, Chaos, and Strange Attractors

By Colin Sparrow

Brand New Book ***** Print on Demand *****.The equations which we are going to study in these notes were first presented in 1963 by E. N. Lorenz. They define a three-dimensional system of ordinary differential equations that depends on three real positive parameters. As we vary the parameters, we change the behaviour of the flow determined by the equations. For some parameter values, numerically computed solutions of the equations oscillate, apparently forever, in the pseudo-random way we now call chaotic ; this is the main reason for the immense amount of interest generated by the equations in the eighteen years since Lorenz first presented them. In addition, there are some parameter values for which we see preturbulence , a phenomenon in which trajectories oscillate chaotically for long periods of time before finally settling down to stable stationary or stable periodic behaviour, others in which we see intermittent chaos , where trajectories alternate between chaotic and apparently stable periodic behaviours, and yet others in which we see noisy periodicity , where trajectories appear chaotic though they stay very close to...
